

Software Project Management

Project Guidelines and Requirements

1. Project Management Board

- Compulsorily use either Trello or Jira.
- Every task, assignment, progress update, and completed work must be visible on the project board.

2. Team Structure

- Each group will consist of 5 members.
- There should be 1 or 2 Project Managers.
- Every member must have a specific role, such as Developer, Tester, System Designer, Deployment Coordinator, etc.

3. Official Role Assignment

- Each member must receive an official email confirming their assigned role.
- The email should mention the role and responsibilities.
- The receiver must acknowledge the role-assignment email, and evidence of both sending and acknowledgment should be maintained.

4. Communication Platform

- Use either Slack or Discord for official project communication.
- WhatsApp communication is strictly not allowed for project work.

5. AI Tools for Development

- Anti-Gravity or any other suitable and productive AI tool may be used for project development.
- AI-generated work should be reviewed and tested before being used in the final project.

6. GitHub and Testing

- The complete project code must be pushed to GitHub.
- The designated tester should test the project using the code available on GitHub.
- Testing activities and identified issues should be documented.

7. Deployment

- The project must be deployed using Vercel, which provides a free deployment option.

8. NotebookLM Research

- Use NotebookLM for project research and post-check research.
- Only one shared notebook should be created and used by all team members.
- Do not create separate notebooks for individual members.

- Research the project module by module and prepare a proper project structure.
- Use NotebookLM to compare tools such as Anti-Gravity and Codex and document which tool is more suitable, what should be used, and how the project should be structured.

9. Basic Project Workflow

- Form the 5-member team and assign roles.
- Send official role-assignment emails and collect acknowledgments.
- Create the Trello or Jira project board.
- Set up Slack or Discord for communication.
- Create one shared NotebookLM notebook and complete module-wise research.
- Select suitable AI development tools based on research.
- Develop the project and track all work on the project board.
- Push the complete code to GitHub.
- Test the project using the GitHub repository version.
- Deploy the final project on Vercel.
- Maintain evidence of project management, communication, research, development, testing, and deployment.
